The symptoms onset occurs in a period between 3 and 7 days following contact with the virus, and the transmission occurs Radiology of Influenza A (H1N1) in indoor areas, even before the symptoms onset. This result was consistent with our study. Because H7N9 virus infection is an extremely contagious and potentially fatal disease, risk stratification in our study using the simple scoring method may help triage patient, and may indicate that more aggressive treatment and closely monitoring of disease progression should be applied to the patient with higher overall radiologic scores.
