Cozzella and Pelttirossi measured Th, U and Pu in urine by ICP-MS rather than alpha spectrometry, highlighting the ability to process a large number of samples whilst maintaining an acceptable measurement uncertainty. Pol J Environ Stud.

Generally, the estimated radiation hazard indices presented in Table 2 for M It is therefore necessary to evaluate the radioactivity levels of coal in order to assess the radiological impacts that may be associated with its exploitation and to develop functional plan and radiation dose control framework for coal workers and the general public. In terrestrial ecosystems, soil corresponds to the major receiving pool of emitted radionuclides. A key challenge for mass spectrometric measurement is removal of isobaric interferences from naturally occurring Ba and Ba isotopic abundances 6. An examination of geochemical modelling approaches to tracing sediments sou review provides a broad assessment of recent developments, improvements in capability and describes the advantages and drawbacks of ICP-MS with regards to sample introduction and instrument design.
